

Context Filter

You use a context filter to specify the design categories to be analyzed, for example Forms or Shared Actions. You cannot use context filters to specify particular elements within a category; all elements within the category will be processed.

The following table defines the syntax to use for each category when you define the context filter parameter in a script call. For example, to analyze only the Forms, Subforms and Folders in a database, you would enter "**-fm-sf-fl**". The string is not case-sensitive.

Category	Syntax
Agent	-ag
Applet	-ap
Component	-co
Composite Application	-ca
Custom Control	-cc
Data Connection	-dc
Database Icon	-ic
Database properties	-*
Database script	-ds
DB2 Data Access Views	-dv
File Resource	-fi
Folder	-fl
Form	-fm
Frameset	-fr
Help About	-ha
Help Using	-hu
