

Installing the Build Manager Configuration Database

If your not using CIAO create the BM Db from the current template.

If an existing Teamstudio CIAO! User ensure that you have upgraded to Teamstudio minimum version 30 and that the CIAO! and Build Manager configuration databases are the same.

Go to CIAO Config and make a copy as a backup then refresh the CIAO Config design with BM template.

Sign it and test usual CIAO operations work

The suggested basic ACL for each instance of the Build Manager database is:

Name	Type	Access	Roles	Permissions
-Default-	Unspecified	No Access	None	None
Anonymous	Unspecified	No Access	None	None
BM_ADMINISTRATOR	Person Group	Manager	IDADMIN DATABASEADMIN ADMIN DELETEADMIN	All
BM_PATHBUILDER	Person Group	Editor	DATABASEADMIN ADMIN DELETEADMIN	Default for editor, without delete
BM_PROMOTER	Person Group	Author	FilteredUser	Default for author but with create documents
BM_APPROVER (Optional)	Person Group	Author	FilteredUser	Default for author but with create documents
LocalDomainServers	Server Group	Manager	IDADMIN DATABASEADMIN ADMIN DELETEADMIN	All

Note that the names of the BM_ADMINISTRATOR, BM_PATHBUILDER, BM_PROMOTER and BM_APPROVER groups are just for illustration in the above table, and can be named as desired. All promotion IDs and Signing IDs should have at least promoter access.
