

TMSGetChildValues(Form <Alias>::<field name>)

This function returns a colon-separated list of field values from child documents in the Analyzer database.

Parameter	Meaning
<Form Alias>	This parameter indicates a form that can be a child of the current document. For example a column can be a child of a view , but a field cannot.
<field name>	This parameter represents a valid text field on the child documents, for example, TMSGetChildValues(CCOL00::fcolTitle) . When run against a view, the document returns a list of titles for all of the child columns.
